ECO 212: Maritime Economics 7/11/2024

Successful Blue Economy Regimes

1. European Union Blue Growth Strategy
2. Blue Innovation Plan
3. Policies and outcomes on Indonesia sustainable growth of marine and coastal regions
4. Guidelines for blue economy development policies.

European Union Blue

This was introduced in 2012. It was a policy that specified that blue growth will be the core of the blue economy.

It's concern,

- Developmental ~~sector that~~ has high potential i.e the boundaries.
- To build essential components to provide knowledge.
- To develop the sea based strategies

Globally, the issue of blue ~~and~~ or Marine economy is of recent and it's effort is to

encourage the reduction on the monumental destructive pressure on the green economy which can contribute to the development of the economy by the increase in GDP, employment generation and improve standard of living of its citizens. The following policies and regime will be examined to show how successful the blue economy has been overtime. Such effort will consider developed economy, such as;

1. European Union's Growth Strategy;

The union propose ~~the blue growth strategy~~ in 2012 which specifies that blue growth will be the core of marine policies with clearly key development areas and specific measures for the future.

The blue growth strategy has launched initiatives in many policy area such as; in Europe, oceans, sea coast, between the maritime business and public authorities. In 2014, the blue economy innovation plan was launched, designed and executed for three (3) specific aspects;

i. The development sector that have high poten-

tials for sustainable jobs and growth.

ii Essential components that provides knowledge, legal certainties and security in the blue economy.

iii To develop sea basin strategy to ensure tailor made measures and foster co-operation between countries

Question

1. Critically Analyse and discuss the European and its contribution to the blue economy

FCO 212 Thursday 14th November, 2024.

Maritime Economics

In 2017, the European Union issued a report on the blue growth strategy towards sustainable growth and jobs in the blue economy. This strategies considered what is ongoing and missing in the blue economy such as;

1. Pushing growth:

The pushing growth strategy addresses 5 major cases through the use of technology to

promote sustainable growth in agriculture, blue energy, coastal and marine tourism, blue bio-technology, and sea-bed mineral resources.

The pushing growth strategy, focuses on how these 3 issues can promote, sustainable growth. through provision of power(energy) and fostering agriculture.

2. The Benefit of Marine Data, Spatial planning and Marine Surveillance to facilitate growth in blue economy:

Marine data is very essential to promote sustainable growth because, previous research on a particular phenomenon in terms of blue energy will show the trend and the benefits in promoting sustainable growth.

3. Promoting Partnership Approach:

No economy can live in isolation because such economy can never be equal to another in terms of technology, man power and other resources in the blue economy, there is need to have a partnership approach to pro-

mote sustainable growth.

4. Boosting Investment:

For sustainable growth in the blue economy there is need to boost investment through diversification, debt (borrowing) and personal savings.

5. Making Blue Growth Strategy Fit For Future Challenges:

The blue growth strategy is a new innovation and we face different challenges such as: risk measures, career paths, and other concerns. There is need to embrace these challenges and produce results that will aid sustainable growth.

ECO 212 Thursday 21st November, 2024

Indonesian's Sustainable Growth Of Marine.

Indonesia has an essential development firm work given it's vast maritime resources.

Indonesia and (ARCHIPELAGIC NATION)

It means a chain of iceland waster together in a body of water). with over 17,000 ice land

and second (2nd) largest coastal line in the world. Heavily relies on its maritime and coastal ecosystem for economic social and environmental sustainability.

The indonesian sustainaible growth of marine has proposed the principle of dereloping marine and fishery industries based on their blue economy concepts;

1. To formulate comprehensive economic and environmental protection policy to boost regional development, realize sustainable development by promoting clean production system and encourage creative and innovative development.

The highlight of the developing blue economy in Indonesia include;

a. To develop marine fishery, marine transportation, tourism, energy and material production industry based on the blue economy.
b. To further improve and co-ordinate marine and land economy national policy.
c. To demonstrate the blue economy zone.
d. To strengthen track and infrastructures and promote

development of technology and human resources.

All of the above can be achieved by setting up a blue economy demonstration growth.

Question

Discuss exhustively three principle of Indonesia sustainable growth that aid the blue economy.

The Guidelines For Blue Economy Development Policy.

To evaluate a guideline for blue economy development policy, major economic system who have developed such guidelines and promote sustainable development will aid the blue economic development policy. A good example is an economic system: "China" who delelop the scientific innovation of the maritime industry. China has been pushing forward scientific innovation in maritime industry and has established (6) national marine economy innovation and development demonstration Area (D.D.A), and Seven (7) national industrial demonstration bases for rejuvenating

the marine industry with science and technology (7) project has been achieved and has produced results through scientific innovation which includes (7);

i "Shandong" Peninsulla blue economy zone
ii Blue Silicon valley
iii Blue Park and bases in the ~~than~~ Yangtze river Delta region.
Yangtze river data region

The Shandong "peninsulla";

* It was approved by the Chinese state council in the year 2011 under the national development and refund commission, it's essence is to nurture developments in;

a. Modern marine technology industry clustered with relatively strong international competitions.
b. A world leading education centre of marine science.
c A pilot cone for national marine economic reforms.
d. A national key demonstration zone of marine ecological civilization zone.

ECO 212 Thursday 5th December, 2024

The Blue Silicon Valley

The work and management committees of the Qingdao blue silicon valley, officially established the commencement of the overall planning and construction of the Quigdao Blue silicon valley in January 31st, 2012. The aim of this establishment is to highlight, the functions of incubating scientific achievement and drive forward innovation, that improves the blue economy.

This innovation created five (5) new towns that integrates scientific research, education and standard of living which was centered on the following;

1. To perform projects on marine science, research and education
2. To achieve convertion and academic exchanges.
3. To speed up clustering of marine high tech research and development,
4. To develop high tech talents,
5. To improve high tech industries and service

organisations.

6. To significantly improve the ability of independent innovation.
7. To achieve convertion and industry cultivation.
8. To establish world leading centres for marine scientific and technological research and development.
9. To establish centres for incubating and trading marine achievement.
10. To establish centres for blue tocerism and health care.

11.

The Marine Park and Basies in The Yangtze River Delta Region

On June 8th, 2018 several marine industry parks and bases, in the yangtze river Delta region signed agreement to implement regional strategic cooperations. The Strategic cooperation of marine industries includes; (5) five parks and bases in ~~an~~ Nantong, Zhoushan, Shanghai, Pudong, Ningbo.

The establishment of these parks and

bases has two major emphasis;

1. To elevate industrial cooperations comprehensively and manage industrial project and resources;

This is done by facilitating, necessary base selection that build service functions to guide project practices, promote development of marine industries within the region.

2. To Deepen cooperations between scientific innovations and talents;

This is to encourage institutions and enterprise in the development of technology transfer, communication and integration by introducing marine talents. This idea was organised by the chinese state of council in 2014.

Other Blue Economy Development Policy Guideline (BEDPG)

In the 13th century, a five (5) year plan for economic and social development of the people in the republic of China requires a widen space for blue economy. The essence

of this is to support industries to venture into the blue economy and promote sustainable growth. The plan suggests complementing domestic fisheries with distant waters to protect and maintain coastal fisheries resources through marine ecology and improved healthy development of distant water fisheries. The plan propose seven (7) key maritime projects:

A. Dragon in the deep sea:

This is achieved through the key technological development of the dragon palace. By "dragon palace" we mean, a constructive deep sea mobile that supports experimental platform. The dragon deep sea, expresses research and develops a system for integrated deep sea environmental monitoring and activity exploration.

B. Snow Dragon Polar Exploration;

It was established as a new shore base observation to advance ice breakers and improve aviation capabilities coupled with land, sea and air, in the polar region. The

essence of this is to improve research and develop exploration technology and equipment for the environment and its innovation

Eco 212 19th December, 2024

Other Blue Economy Development Policy Guideline (BEDPG) (Cont'd)

3. The Multi-dimensional global system Observation Network;

It makes overall planning the layout of national ocean observation (monitary) network moves ahead with the development of real time outline. Monitary system and oversea observation for the maritime environment.

4. Maritime Ecological Civilization Construction;

It emphasizes on sustainable development. Ocean resources while preserving marine eco-system and bio-diversity. It includes goals like reducing ocean pollution, restoring marine habitat and promoting ecological balance.

5. Blue economy Innovation cluster;

It aims at creating innovation clus: focus on marine industries like deep sea mining marine renewable energy, bio tech and high earned marine engineering the faster regional development.

6. Belts And Road Marine Co-operation;

Under this initiative, the policies highlight ocean based, international made route collaborative ports infrastructure investment and marine service and technology exchanges.

7. Marine Equipment And Technology Advancement Programme;

It encourages the development and application of high-tech marine equipment including autonomous vehicles, deep-sea robots and advance noval architecture.

8. Ocean Energy Development Strategy;

This focuses on expanding off-shore wind farms, tidal and wave energy and other renewable marine project, to promote clean energy transitions.

These guidelines reflects China comprehensive approach to live raging its marine resources for

economic growth while maintaining sustainability.

Blue Economy Management Technology

1. Data analysis And Information delivering Support Observing enterprise.

The great Lake Observing System {GLOS} is one of the ~~elements~~ (1M) regional association in integrated Ocean Observing system {IOOS}. Their role is to coordinate science and technology communities around data and information for policy makers. GLOS provides grants to partners for development of models required for system operations for development of models required for sustain operations and maintenance. They address challenges around the marine ecosystem by providing fundings and business models to operation areas. Example;

a. Crowd source funding for cost of ongoing operations and maintenance.
b. Mutti-Sector based business models
c. Service based business models.
d. They provide important insights into larger ocean observating enterprise geared towards the growth of blue economy.

2. Delimitation of Technology for Marine Spatial Planning;

Due to resource constraint and serious environmental pollution and degradation, an ecological civilization that respects nature, conforms to nature and protects nature was established.

China in 2018 Launched the largest reform of the state council to assemble and perform the responsibilities of owning all natural assets, managing utilization, protecting and rehabilitating the ecological environment uniformly.

3. Comprehensive Governance Of Marine Environment;

This involves government attacking great importance to the prevention and control of marine environmental pollution. A comprehensive plan should be marked out with scopes, objectives, key tasks etc to improve ecological environmental qualities. The chinese government has the action plan to improve the quality of "Bohai sea" and solve ecological problem since 2018. By 2020, a good proportion of the sea

coastal water quality will reach about 73% in terms. They have action plan for four areas of focus;

i. Land Based Pollution Control Action;

This controls rivers entering the sea, strict industrial pollution resource, discharge, unreasonable sewage outlets, rural and urban pollution prevention and control.

ii Marine Pollution Control actions

These includes implementing ships and port pollution control, improvement of fishing port environment, prevention of marine garbage pollution, co-ordinating mechanism for land and sea planning.

iii Ecological Protection And Restoration Action;

Includes strict Observation/observance of the red line of marine ecological protection, restoration of "estuarines" and base, restoration of coastal shore line & conservation of marine resources.

iv. Environmental Risk Prevention Action;

This includes implementation of marine oil spill risk prevention, marine ecological disaster warning and emergency response and land base emergency, environmental incidents risks prevention.
